

## An Electronic Cure To AIDS

Years ago I received AIDS cure specifications from a trusted source.

It seems that the Aids Virus is in reality so simple in its structure that no chemical component will be able to destroy it. There are 9000 to the 4th power possible AIDS viruses (9000 base pairs on the genome) so human misery worldwide has just begun. Because of the trillions of possible genetic combinations, there will never be a vaccine to end this plague. The HIV will be constantly changing and attacking humans with new esoteric diseases, forever mutating faster than scientists can conjure up cures.

This Virus can be destroyed using the following system :

- \* A source of electric pulses of 430 GHz, (but even 4.3 GHz would suffice) and a varying amplitude of 20-80 volts
- \* The pulses must be applied to human body by means of electrodes. The pulses application is in a pattern of two kind of pulses with different duration (340 ns and 500 ms)
- \* The pulses must be alternated in amplitude, from 20 to 80 volts (aleatory) each 0.1 sec
- \* The application of pulses must be done in sessions of 1 to 5 minutes, ten sessions per day, until the virus disappears

It can also be done with the socalled Hulda Clark Zapper – less than 100 Dollars – availbale at eBay for example.

It is not the voltage that kills AIDS. It is the pulsation doing the job.

The above cure works a lot better and faster than Oxy Therapy.

That's why we should not seek for a solution in the area of biomedicine. Simply "electrocute" AIDS.
